Sprint 25 — Kickoff / framing note (v2.0 — OVERHAUL)

*(Paste when assigning to Codex — **after the rotation is confirmed**. Detailed contract:* `SPRINT_25_SPEC.md` ***v2.0.)***

Sprint 25 — eBay publishing OVERHAUL. Full spec: `SPRINT_25_SPEC.md` . Scope grew: this is no longer just a quick-publish button — the owner reports publishing **errors outright**, and the flow is **buried, has fewer controls, and the draft + review step feels gone**.

Two causes, two fixes:

- **The errors are eBay's doing:** API/third-party integrations went **Pro-Basic-and-above on 12 May**; the owner was on free selling → calls were plan-gated for two months. **He is now on Pro Basic (12 Jul) — the API is available again.**
- **The UX regression is ours:** Sprint 22 put copy packs in the Listing section and **Sprint 24's page reorg demoted the Phase-4 publish surface** — and Sprint 24's mandated *"no content lost"* checklist **was never filed**, so nothing caught it.

⛔ **PREREQUISITE:** the **secret rotation** must be done first (new eBay client secret + rotated local secrets + credentials re-entered). Not just hygiene — the reconnect it forces mints a fresh token under the new Pro Basic plan.

Order of work — do not skip:

1. **Diagnose (Phase 0):** after reconnect, retry a publish and **capture the exact error or success. Report before writing UI code.**
2. **Audit (Phase 1):** written inventory diffing the current publish surface against **Phase 4's** (git history) — what fields/controls/steps existed then vs now. **Deliver it before rebuilding.**
3. **Restore (Phase 2):** the **full draft + review flow**, first-class — title · eBay category mapping · item specifics · condition · price + format · quantity · photo order · postage/policies · description · duration; edit any field, save, resume, publish. **Nothing fewer than Phase 4 had.** The **eBay tab becomes the hub** (drafts · live · orders · connection health); the item page gets a **primary "Publish to eBay" at the**

TOP of the Listing section — copy packs move below it (they stay, for other channels).

4. **Quick publish (Phase 3):** the preview-gated two-tap sits **on top** of that pipeline — preview with hard gates (price source per D-129, ≥1 photo, postage, condition, healthy connection), then one "Post live" tap → live URL + `ChannelListing` row. **Zero-tap/batch/background posting stays forbidden.**
5. **Honest errors + connection health (Phase 4):** named, actionable failures (plan/permission, token expiry → Reconnect, validation → the offending field); a connection-health panel (account, token status, last successful call, scopes). **A silent two-month outage must be impossible to repeat.**
6. **Newly unlocked (Phase 5): multi-quantity listings** (Pro-only) wired to `quantity_total`, respecting Sprint-10 partial-quantity semantics. Variations/volume pricing/bulk tools: **out of scope**, noted.

Fee engine (mandatory): seller mode → `pro_other` with the **real Pro Basic FVF % supplied by the owner from eBay's fee page — never guessed** (fee provenance: an estimate is never passed as a fact). Pro international fee = **1.1%** (not 3%). Buyers pay **no BPF on Pro listings** ⇒ his own listings are seller-receives basis; **captured comps keep the existing unknown-basis rules**.

Don't get these wrong: rotation → diagnose → audit → build, in that order. **Restore against evidence, not memory — nothing fewer than Phase 4.** Prices from D-129 sources only. Skipping the preview must be structurally impossible. The **one real live post** is validated **with the owner present, on an item he genuinely wants listed**. **Never echo `.env` values. Quote head hash + Validation run ID in the closure.**

Reasoning: high.

Done = Phase-0 diagnostic reported → Phase-1 audit inventory delivered → draft/review restored + field-by-field checklist vs Phase 4 (nothing lost) → **one real live listing published with the owner** (URL + `ChannelListing`) → quick-publish gates block + name blockers (tests) → forced-error tests give named actionable messages → connection health accurate → multi-quantity respects Sprint-10 semantics → no zero-tap path → copy packs + take-down checklist regression-green → **dual-lane Validation green** → **phone screenshots** (hub, draft editor, gated preview, live URL) → closure quotes **hash + run ID**. Evidence as `SPRINT25_EVIDENCE.md`.

> **Also still owed (not superseded):** Sprint 24 round 2 (title-save bug, raw-JSON candidate rendering, safe-area regression, rationale UUID) **and the closure evidence for 23R2 + 24R1**. The missing "no content lost" checklist is *why* this sprint exists.
