Magpie — Sprint 25 spec (v2.0): eBay publishing OVERHAUL

Audience: Codex. **Author:** Claude. **Status: LOCKED — one prerequisite (rotation).** Supersedes the v1.0 "quick publish" scope: quick-publish is now **one layer of a larger restoration** (D-133 extends D-132). **Locks:** D-132 (preview-gated publish), **D-133 (this overhaul)**, human-confirmed publish (nothing goes live without explicit confirmation; zero-tap forbidden), D-129 (prices only from the human's figure or a picked evidence figure). **Facts:** F-19, **F-20 — RESOLVED: Regan is on eBay Pro Basic (12 Jul 2026, AU$27.45/mo) → API + third-party integrations are AVAILABLE on his tier.**

---

1. Why this sprint exists

Two distinct problems, two distinct causes:

- **Publishing errors outright.** eBay made API/third-party integrations **Pro-Basic-and-above from 12 May**; Regan was on free selling → Magpie's eBay calls were plan-gated for two months. **Hypothesis: this clears now he's on Pro Basic.** Must be proven, not assumed (§3).
- **The publish experience regressed.** Regan reports the flow is **buried/hard to find**, has **fewer fields and controls**, and the **draft + review step feels gone**. Leading cause: Sprint 22 placed copy packs in the Listing section and **Sprint 24's page reorganisation demoted the Phase-4 publish surface** — and Sprint 24's mandated "no content lost" checklist **was never filed as evidence**, so nothing caught it. This sprint restores it.

2. PREREQUISITE (absolute)

The secret rotation must be completed first (§7.3 of the handoff): regenerate the eBay client secret at developer.ebay.com; Codex rotates SECRET_KEY / MAGPIE_TOKEN_ENCRYPTION_KEY / MAGPIE_BACKUP_PASSPHRASE (never printing values; keep the old backup passphrase noted for historic archives); Regan re-enters the eBay + OpenAI credentials. **This is not just hygiene — the reconnect it forces is what mints a fresh eBay token under the new Pro Basic plan.**

3. Phase 0 — Diagnose before building (report back first)

After rotation + reconnect: **retry a publish and capture the exact error or success.** Report the raw error (status, eBay error code/message) to Regan/Claude **before writing UI code**. Three outcomes:

- **Succeeds** → the gating hypothesis is confirmed; the overhaul is purely UX restoration (Phases 1–4).
- **A different, specific error** (scopes, policies, category, token) → fix that, report it.
- **Still permission-denied** → stop and report; the plan assumption needs revisiting.

4. Phase 1 — Audit what was lost (written inventory, before rebuilding)

Diff the **current** eBay publish surface against the **Phase-4** implementation (git history: the original eBay draft → review → publish work). Produce a written inventory: which fields, controls, and steps existed then; which exist now; what Sprints 22/24 demoted, hid, or dropped. **Deliver the inventory before rebuilding** — we restore against evidence, not memory.

5. Phase 2 — Restore the draft + review flow as first-class

- **The full listing draft editor**, with nothing fewer than Phase 4 had: title · eBay **category mapping** · **item specifics/aspects** · condition · **price + format** (fixed/auction) · **quantity** · photo selection + order · **postage/policy selection** · description (copy-pack template as the default body) · listing duration.
- **The review step returns:** see the composed listing, edit any field inline, then publish. The draft is editable, savable, and resumable.
- **Prominence restored:** the **eBay tab becomes the hub** (drafts · live listings · orders · connection health). The item page's Listing section gets a **primary "Publish to eBay" action at the top of the section** — copy packs move *below* it (they remain, unchanged, as the manual/other-channel path).

6. Phase 3 — Quick publish (the original D-132, preserved on top)

Preview-gated two-tap over the restored pipeline: **tap 1** = composed-listing preview (title · photos · **price with its D-129 source label** · postage · condition · category ·

description) with **hard readiness gates** (price source, ≥1 photo, postage, condition, healthy connection — failures listed, Post disabled, one-tap fix links); **tap 2** = "Post live to eBay". Success → live URL + `ChannelListing` **row written** (Sprint-22 board + take-down checklist stay truthful). **Zero-tap / batch / background posting remains forbidden.** The full draft path (Phase 2) remains the deep route; quick-publish is the fast route over the *same* pipeline.

7. Phase 4 — Honest errors + connection health

- **Named, actionable errors** — never a generic failure: permission/plan errors say so ("eBay rejected this — your plan may not include API access"); token expiry → "Reconnect eBay"; validation errors map to the **offending field** in the draft editor.
- **Connection health panel** on the eBay tab: connected account, token status/expiry, last successful call, granted scopes, a Reconnect button. This is what makes a two-month silent outage impossible to repeat.

8. Phase 5 — Newly unlocked (Pro Basic), scoped tight

- **Multi-quantity listings** are now available (Pro-only feature): wire `quantity_total` → listing quantity, **respecting the Sprint-10 partial-quantity semantics** (sold X of Y; the take-down checklist raises only at zero remaining). Genuinely valuable for bulk lots.
- **OUT of scope:** variations, volume pricing, Discounts Manager, bulk tools — noted as available, deferred.

9. Fee engine (mandatory, blocks correct maths)

- Seller mode moves `free_selling` → **`pro_other`** with **Regan's real Pro Basic FVF % — entered by the human from eBay's Pro selling fees page / Seller Hub; NEVER estimated or guessed** (fee-provenance discipline: an estimate must never be passed as a fact).
- Pro plans pay the **1.1%** international fee (not free-selling's 3%) — configurable.
- **Buyers pay no BPF on Pro listings** ⇒ Regan's own listings are seller-receives basis. **Captured comps from other sellers keep the existing unknown-basis rules unchanged** (Sprint 18).

10. Acceptance criteria (closure gate)

- **Phase 0 diagnostic reported** (exact error or success) before UI work began.
- **Phase 1 audit inventory delivered**; the restored flow is checked **field-by-field against it — nothing fewer than Phase 4** (checklist in evidence).
- **Draft + review**: create → edit every field → save → resume → publish (tests + live proof).
- **Publish works live: ONE real listing, Regan present, an item he genuinely wants listed** (never fabricated data) → live URL + `ChannelListing` row (test + live proof).
- **Quick publish**: each gate blocks and names the blocker (tests: missing price/photo/postage); price line honours D-129 sources only (test).
- **Errors**: forced-error tests (expired token, validation failure, permission denied) each produce a **named, actionable** message; connection health panel reflects real state.
- **Multi-quantity** respects Sprint-10 partial-quantity semantics (tests).
- **No zero-tap path exists** (assertion/review note). Copy packs + take-down checklist regression-green.
- Suites/typecheck/build/collectstatic green; **dual-lane Validation green**; additive-only migrations (backup + restore spot-check if any); Administrator restart; **phone screenshots headline** (eBay hub; draft editor; gated preview; live URL). **Closure quotes head hash + Validation run ID.** Evidence as `SPRINT25_EVIDENCE.md`.

11. For Codex

Reasoning: High. Rotation first; diagnose second; audit third; only then build. The governing rule of this sprint: **restore capability against evidence, not memory — nothing fewer than Phase 4 had.** Prices only from D-129 sources; gates hard; failures named; `ChannelListing` truthful; zero-tap forbidden. **Never echo `.env` values** (the rotation will have just happened — treat the new secrets with the same discipline). Evidence as `SPRINT25_EVIDENCE.md` with hash + run ID.

> **Still outstanding and not superseded:** Sprint 24 round 2 (title-save bug, raw-JSON candidate rendering, safe-area regression, rationale UUID) **and the closure-evidence catch-up for 23R2 + 24R1**. The missing Sprint-24 "no content lost" checklist is *why* this sprint exists — file the evidence.
