Magpie — Sprint 16 spec: Settings completion (AI credential) + mobile fit & readability

Audience: Codex. **Author:** Claude. **Status: ready to implement. Locks:** D-125 (references D-123 / Sprint 15, D-114 sign-off spine, F-14 runtime). **References:** Sprint 15 (the live cloud-AI backend this finishes wiring a UI to) and the existing eBay-credential settings pattern (reuse it).

---

1. Why this sprint

Two things, bundled because both are frontend and both block real use:

1. **Sprint 15 is stranded.** The cloud-AI backend is fully deployed and healthy (`/api/ai/status/` returns 200, `provider: openai` , cap + disabled-reason present), **but there is no UI in Settings to enter the API key** — so the credential can't be configured, `enabled` can't flip true, and Sprint 15's real-provider gate can't close. This sprint adds the missing key-entry/management UI.
2. **The app doesn't fit a phone.** Magpie is meant to be a mobile PWA, but screens render desktop-cramped — the dashboard KPI/policy cards **overflow off the right edge of the viewport**, and Settings is **hard to read** on a phone. This sprint makes the existing screens fit and read well on a phone.

This is a **fix + polish** sprint: finish the Sprint 15 wiring, and make the PWA usable on the device it's meant for. **No new features, no redesign.**

2. Scope

IN:

- **A — AI credential management in Settings** (completes Sprint 15) — §3.
- **B — Mobile fit & readability pass** on the existing screens — §4.

OUT (explicitly):

- ❌ Any **redesign** / new visual language — keep the dealer's-ledger look; just make it fit and read on a phone.

- ❌ New features beyond the credential management UI.
- ❌ Backend changes beyond what's needed to **save/clear the encrypted AI key** + set the model (the rest of Sprint 15's backend is done).
- ❌ Photo fix-up — that's **Sprint 17** (the next and last sprint).

3. Part A — AI credential management in Settings

Add an **AI provider section to Settings**, beside the eBay credential, **reusing the eBay-credential UI/flow pattern**. From a phone, the user must be able to:

- **Paste the OpenAI API key and save it** — stored **encrypted** via the existing `AICredential` (Fernet pattern, same as `EbayCredential`). If a **backend write endpoint** to save/clear the key doesn't exist yet, add it. The key is **never logged, never returned in any response, never committed** — on save, respond only with status (configured/enabled), not the key.
- **See it flip to connected** — after saving, `/api/ai/status/` shows `configured: true` and `enabled: true`, and the section reflects that.
- **See** provider + active **model** + monthly **usage / cap / remaining** (the status endpoint already returns these).
- **Remove / replace** the key (disconnect).
- **Never display the stored key back** — show masked / "configured," never the secret.

Model correctness (important): the current default `model_id` is `gpt-4.1-mini`, which is **likely deprecated** at OpenAI by now — a real call on a dead model 404s. So:

- **Default to a current OpenAI multimodal model** (verify the current model string at implementation time — the GPT-5 mini class is the current cheap multimodal tier; do **not** ship a known-deprecated default).
- **Make the model user-settable** in this section (a field/picker), so the model can be changed without a code change. Keep it provider-agnostic-friendly (the adapter already is).

4. Part B — Mobile fit & readability pass

Make the **existing** screens fit and read on a phone — **fit-and-readability, not redesign**:

- **No horizontal overflow at phone widths.** The dashboard KPI tiles and the "Policy Readiness" / "Order Sync" cards currently run off the right edge — they must wrap/stack/scale to the viewport. Nothing should require sideways scrolling.
- **Readable** type sizes, line-height, and spacing on a phone (Settings especially is hard to read now).
- **Responsive layout** for the main screens — dashboard, Settings, item detail, item list, sales, eBay — cards stack and scale for narrow viewports; tap targets are finger-sized.
- Keep the **dealer's-ledger** tokens (cool paper, ink, hairline rules, tabular figures, restrained gold) — this is about *fit and legibility*, not a new look.
- Use the `frontend-design` skill for the responsive/readability conventions in this environment.

(Reference: the user's phone screenshots show cards overflowing the right edge on the dashboard and cramped, hard-to-read Settings — those are the target conditions to fix.)

4b. Part B — ROUND 2 (added 2026-06-15 after first pass; Part A is done + validated)

Round 1 landed Part A (credential form) and *some* fit, but on a real phone the item/Settings forms still have **two concrete problems**, plus a colour overhaul Regan has asked for. **Legibility for Regan's eyes is now the explicit priority — it overrides the muted "dealer's-ledger" palette wherever they conflict** (D-126).

(i) Bright, high-contrast, easy-on-the-eyes colour scheme — the headline of round 2:

- **The labels/helper text are the core problem: pale grey on cream — too low-contrast.** Every label and helper line must become **dark and strongly contrasting**. **No pale-grey-on-light text anywhere.**
- Move to a **bright, light scheme** — a clean near-white background (brighter than the current cream), dark high-contrast text throughout, **one clear accent**, clearly-outlined fields, and a **larger base font** for comfortable reading.
- **Contrast targets:** labels and body text **aim for WCAG AAA (~7:1)**, and **never below AA (4.5:1)**; large text ≥ 3:1 (prefer 4.5:1). The current grey-on-cream labels fail this — that's the bug to kill.
- **Starting-point palette (adjust to hit the targets + look clean — not garish):**

page `#FFFFFF` (or a barely-warm `#FCFCFA`); primary text/labels `#0F172A` (~16:1 on white); secondary/helper text `#334155` – `#475569` (~7–9:1, **not** pale grey); fields white with a clear `~#475569` border + dark text **or** keep dark fields with white text *only if* the overall impression stays bright and labels are dark; a single strong accent that meets contrast for any text on it (e.g. blue `#1D4ED8`, or a deepened gold `#B45309` if keeping brand warmth). Keep it restrained and uncluttered.

- This is a **recolour + legibility pass**, not a structural redesign — same screens and layout, made bright and readable.

(ii) Remaining overhang / safe-area (still broken in round 1):

- **Content runs under the iOS status bar / notch** at the top of forms (labels like "Acquisition cost" are cut by the clock). **Respect the top safe-area inset** (`env(safe-area-inset-top)` / proper viewport handling) so nothing sits under the status bar or notch.
- **The right-edge drawer/handle tab overlaps the form content.** It must **not cover content** — fix its placement/z-index, or give content the margin it needs. Also re-confirm **no horizontal overflow** on the item-detail and Settings forms specifically (these were still overflowing).

(iii) Housekeeping: tidy the 4 leftover Sprint-16 screenshot files (modified/unstaged from the earlier harness rerun) so the working tree is clean before this commit.

5. Acceptance criteria (closure gate)

Part A:

- From **Settings on a phone**, the user pastes the OpenAI key → saves → `/api/ai/status/` **shows** `configured: true, enabled: true` → provider / model / usage / cap visible → can remove/replace. **The key is never logged, returned, or committed** (assert).
- The active **model is a current OpenAI model** (no deprecated default) and is **user-settable**.

Part B (incl. round 2):

- **Colour/legibility: every label and helper line is dark, high-contrast text** (labels/body **≥ AA 4.5:1, aim AAA ~7:1**); **no pale-grey-on-light text** survives; the scheme reads **bright and easy to see**; base font comfortably readable. (Regan eyeballs the screenshots and confirms it's comfortable — his eyes are the standard.)

- **Safe-area / overhang: no content under the status bar / notch** (top safe-area inset respected); the **drawer handle doesn't cover content**; **no horizontal overflow** on dashboard, Settings, item detail (incl. the cost/specifics forms), item list, sales, eBay at ~390px wide.
- Cards **fit and stack**; tap targets finger-sized. Structure/layout unchanged (recolour + fit, not a redesign).
- **The 4 leftover Sprint-16 screenshots are tidied** (clean working tree).

Process:

- Backend + frontend tests green; **dual-lane Validation green**; rebuild + restart the `Magpie` service; **phone screenshots are the headline evidence** (dashboard + Settings with the AI section + a couple of other screens) + desktop; additive migration only (likely none); **pre-migration encrypted backup + restore spot-check if any schema changes**. Evidence as `SPRINT16_EVIDENCE.md`.
- **On close, Sprint 15's real-provider gate can finally be exercised** — Regan pastes the key from Settings, then runs one real Identify & fill (Regan present) to fully close Sprint 15.

6. For Codex

Reasoning: High. Part A (credential form) is **done + validated** — leave it working. **Round 2 is now the job (§4b):** (i) a **bright, high-contrast, easy-on-the-eyes colour pass** — kill the pale-grey-on-cream labels, dark high-contrast text everywhere (aim AAA), bright light scheme, larger font — **legibility for Regan's eyes overrides the muted palette** (D-126); (ii) fix the **safe-area/overhang** (content under the status bar + the drawer handle covering the form + any item-detail/Settings overflow); (iii) **tidy the 4 leftover screenshots**. It's a **recolour + fit pass, not a structural redesign** — same screens, made bright and readable. Don't print/commit the API key, `.env`, secrets, OAuth tokens, rclone config, backup passphrase, or encryption keys. Evidence as `SPRINT16_EVIDENCE.md`; **phone screenshots are the headline evidence** and Regan signs off on legibility. This is the fix/polish sprint before the final one (**Sprint 17 = photo fix-up**).
