Magpie — Sprint 22 spec: multi-channel copy pack + sold-everywhere board — CHAPTER FINAL

Audience: Codex. **Author:** Claude. **Status: ready to implement. Locks:** D-131 (sequencing — step 6, the final step; scoped per the Claude↔ChatGPT convergence: **copy-gen + manual paste + a manual checklist — never auto-posting**), D-129/D-121 (no generated prices), F-09 (no scraping), F-20 (**zero new eBay API usage** — and this sprint is deliberately the hedge if the plan check lands badly). **Builds on:** Sprint 17 (photo derivatives), Sprint 20 (cash-lock "listed" semantics), Sprint 21 (live at `8e57dce`). **Closing this sprint completes the profit-engine chapter.**

---

1. Goal

Sell the same item on more channels **without lying about what's automated and without double-selling**. Facebook Marketplace and Gumtree have no APIs (F-18/F-19 context) — so the honest help is: **ready-to-paste listing copy per channel**, a **photo-set export** for manual upload, a **board that knows where each item is listed**, and a **loud take-down checklist the moment something sells anywhere**. Bonus by design: the eBay copy pack keeps eBay selling fully workable **by hand** if F-20 gates the existing API integration.

2. Scope

IN: channel **copy packs** (§4) · **photo-set zip export** (§5) · the `ChannelListing` **board** (§6) · the **sale → take-down checklist** (§7) · cash-lock "listed" = any-active-channel (§8).

OUT (explicitly):

- ❌ **Auto-posting to anything** — no Facebook/Gumtree automation of any kind (no APIs exist; scraping/botting violates ToS and risks accounts). Posting is the human pasting.
- ❌ **New eBay API usage** (F-20 gate) — eBay board rows are **seeded from existing local publish records only**; no listing-end API calls, no sync additions.
- ❌ **Generated prices** (D-129/D-121) — the copy pack's price line prefis **only** from

the human's own set price on the item, or a figure the human explicitly picks from the evidence panel. Blank if neither exists.

- ❌ New AI paths — templates are **deterministic and local**. (The existing Sprint-15 approved copywriting assist remains available, untouched; this sprint adds nothing AI.)
- ❌ Scraping / fetching / warehousing anything (F-09).

3. Data model (additive; backup/restore required)

- `ChannelListing` : item FK · **channel** (`ebay` / `facebook_marketplace` / `gumtree` / `in_person` / `other`) · `listed_at` · `ended_at` (nullable) · status derived (active = no `ended_at`) · optional URL/note.
- **Seed eBay rows** from existing local publish/listing records (a data migration or an idempotent seed step — **no API call**; if the local record is ambiguous, seed nothing and let the human add the row).
- **Channel templates** live as **data** (registry/config, per the Sprint-14 URL-registry pattern), not code — adding/editing a channel's template is an edit, not a deploy.

4. Channel copy packs

Per item, render **ready-to-paste copy per channel** from item fields via **deterministic local templates**:

- Sections: **title · description (category fields + condition + the item's own notes) · price line · postage/pickup line** — tuned per channel's conventions (eBay fuller; Facebook/Gumtree shorter, pickup-forward; `generic` plain).
- **Copy buttons per section + "copy whole ad."** Missing fields render as visible gaps (e.g. "[condition not set]"), never invented content.
- **Price line:** prefilled only from the item's own asking/listed price, or a human-picked evidence figure ("use this" from the Sprint-19 panel); otherwise blank with a hint. **Never computed, never suggested.**
- Templates carry **no claims the data doesn't support** (no "mint," no "rare," nothing the fields don't say — the D-124 honesty spirit applied to words).

5. Photo-set zip export

One tap exports the item's **display photos** (approved Sprint-17 derivatives where

present, else originals) as a **zip** for manual upload to Facebook/Gumtree. Own photos only (D-124 stands); no recompression beyond what packaging requires.

6. The listings board

- **Per item:** its `ChannelListing` rows — where it's live, since when, where it's ended. Manual **add / mark-ended** for non-eBay channels (and for eBay rows the seed couldn't infer).
- **Board view:** items with active listings, grouped by channel; days-listed shown (feeding the existing stale nudge).

7. Sale → take-down checklist (the double-sell guard)

- Recording a `SaleRecord` (any channel) for an item with **other active** `ChannelListing` **rows** raises a **loud, persistent checklist**: *"Still listed on: Facebook, Gumtree — take them down."* Each tick sets that row's `ended_at`. The flag **does not clear until every row is ticked** — visible on the item, the board, and the dashboard.
- **Never automated** — the human ends the real listings on the real platforms; Magpie tracks the truth of it.
- Partial-quantity sales (multi-quantity items): the checklist raises only when remaining quantity hits zero (reuse the Sprint-10 partial-quantity semantics); before that, the board shows "sold X of Y — listings still valid."

8. Cash-lock integration

"Listed" in the Sprint-20 cash-lock now means **any active** `ChannelListing`; items with none fall back to the prior signal, else **unlisted**. Stale threshold applies per the earliest active `listed_at`. (Semantics change is small and must be test-pinned so the buckets don't silently shift.)

9. Design

Sprint-16 bright high-contrast tokens; phone-first. The copy pack is a tap-copy-paste flow that works standing in front of a Facebook form; the take-down checklist is **impossible to miss** (it's the feature). No overflow at 390 px.

10. Acceptance criteria (closure gate)

- **Copy packs:** golden tests per channel template (known item → exact expected copy); missing-field gaps render visibly; **price line only from the item's own price / a human evidence pick — never computed** (test); template registry is data (adding a channel needs no code change — demonstrate).
- **Photo zip:** exports display derivatives (falls back to originals) — test.
- **Board:** eBay seed from local records only (test; ambiguous → none); manual add/end round-trips (test).
- **Take-down checklist:** raises on sale with other active listings; persists until every row ticked; partial-quantity raises only at zero remaining (tests).
- **Cash-lock:** "listed" = any-active-channel with fallback, test-pinned so bucket totals are explicit.
- **No auto-posting anywhere; no new network calls; no new eBay API usage** (asserts; F-09/F-20).
- **Process:** suites + typecheck/build/collectstatic green; **dual-lane Validation green**; additive migrations with **pre-migration encrypted backup + restore spot-check** (`ChannelListing` + seed); Administrator restart; **phone screenshots headline** (copy pack in use, the take-down checklist raised); **closure message quotes head hash + Validation run ID** (the standing norm). Evidence as `SPRINT22_EVIDENCE.md`.

11. For Codex

Reasoning: High. This sprint's honesty **is** the feature: copy that never claims what the data doesn't say; prices never invented (D-129); posting never automated; the checklist never self-clears. **Hard lines:** zero new eBay API usage (F-20 — the eBay board rows come from **local** records only); no scraping (F-09); templates deterministic + stored as data; photo export uses the user's own photos only (D-124). Additive migrations + **backup/restore**. **Never echo `.env` values** — the credential rotation is still in progress. Evidence as `SPRINT22_EVIDENCE.md` with hash + run ID quoted. **Closing this sprint completes the profit-engine chapter (D-131)** — the buy side (calculator + evidence bank), the books (profit intel + lots + sources), and the sell side (this) will all be live.
