Magpie — Sprint 24 spec: AI apply flow + item-page organisation

Audience: Codex. **Author:** Claude. **Status: ready to implement** (sequence after Sprint 23 round 2 closes — serial recommended). **Origin:** field use — a real Identify & fill on a banknote (the AI read the serial off the photo) staged 4 suggestions the owner **couldn't find how to apply**, on an item page that has grown into one long scroll. **Locks:** D-114 (per-field sign-off spine), D-115 (curated scope; title/description = editable copywriting drafts), D-129 (no generated values outside the approved-suggestion path), D-124. **Facts:** F-09/F-20 (no scraping / no new eBay API). **Builds on:** Sprints 13/15 (FieldSuggestion + review), 23 (Banknotes schema), Sprint 16 tokens.

---

1. Goal

(A) Staged AI suggestions become **findable and fully applicable** — one tap from the completion banner into review; the identify scope covers **as much of the category schema as the evidence supports, including a title draft**; batch review makes applying many fields fast without weakening human control. **(B)** The item page stops being one long scroll: **named collapsible sections**, state remembered, with a **left-hand section index on desktop**.

2. Scope

IN: banner→review deep link (§3) · full-schema identify scope incl. title/description drafts (§4) · batch review flow (§5) · sub-cent usage display fix (§6) · collapsible item-page sections + desktop index (§7). **OUT:** any auto-persist of suggestions (D-114 stands absolutely); any new AI/network paths beyond the existing adapter call; changes to what the AI may propose for valuation/grade/catalogue-authority (D-115 candidates-only rules unchanged); removing any information from the page (reorganisation only).

3. Banner → review

The Identify-&-fill completion banner becomes an action: **"Review N staged suggestions →"** — navigates/auto-expands the suggestions review section. The review panel lives directly adjacent to the AI actions (same section), not elsewhere in the scroll.

4. Full-schema identify scope (+ title)

- Audit the **per-category identify scope config** so each category — **Banknotes first** — stages suggestions for its full curated schema where the model returns evidence: country, denomination, series/year, prefix/serial, signature/variety, catalogue-ref **candidates** (candidates-only, unchanged), condition **observations** (observations-only, unchanged), plus the **title draft and short-description draft** (D-115 copywriting: clearly editable drafts, never auto-applied).
- Scope remains **config, not code** (the D-115/Sprint-23 pattern) — demonstrate a scope edit without a deploy.
- Nothing here changes what requires human approval: **everything stages; nothing persists without a click** (regression stays green).

5. Batch review flow (Sprint-17 precedent)

- The review panel renders **all** staged suggestions with the existing **per-field Approve / Edit / Reject** controls retained.
- Add **"Approve all shown"** — a convenience acting on the **fully rendered, visible list** (disabled until the list has rendered; excludes anything the user already rejected/edited). This is batch *review flow*, not auto-approval: one explicit human action over a seen list, per the Sprint-17 photo precedent; **per-suggestion controls remain the primary spine (D-114)**. State this framing in code comments + the evidence.
- Applying the title/description drafts writes them into the item exactly like any approved field (with `ai` provenance, as existing).

6. Usage display honesty (micro)

Sub-cent monthly usage must never display as **$0.00**: show **"<$0.01"** (or 4 decimals) whenever usage is nonzero. A false zero is a small dishonesty; kill it.

7. Collapsible item page + desktop index

- Reorganise the item detail page into **named collapsible sections** (final grouping is Codex judgement over what exists — indicatively: **Photos · Core details · Category specifics · AI research · Pricing evidence & comps · Listings/channels · Sales & valuations**). **No content removed.**

- **Defaults:** Photos + Core details open; the rest collapsed. **Expand-all / collapse-all** control. **Per-user state remembered** (server-side preference à la `DashboardPreference`, or the simplest consistent persistence — Codex judgement, but it must survive reloads on the phone).
- **Phone:** accordions with sticky section headers, finger-sized, no overflow at 390 px. **Desktop (wide viewports):** a **left-hand section index** that jumps to and expands sections.
- **Deep links/anchors work:** the §3 banner action expands the AI section; any existing links into page regions still land correctly.

8. Acceptance criteria (closure gate)

- **Banner action** navigates + expands the review section (test/proof).
- **Scope:** Banknotes stages the widened field set incl. **title + description drafts** on a real-shaped fake response (test); scope-is-config demonstrated; **candidates-only + observations-only rules unchanged** (existing guards stay green); **nothing persists without a click** (regression).
- **Batch:** "Approve all shown" applies exactly the rendered, non-rejected set (test); per-field controls still work (test).
- **Usage:** nonzero-sub-cent renders "<$0.01" (test).
- **Page:** sections collapse/expand; defaults correct; **state survives reload** (test); expand/collapse-all; desktop left index jumps+expands; phone accordions at 390 px with no overflow; **no content lost** (checklist against the pre-change page in evidence).
- **No new network calls / no new AI paths** (assert). Suites + typecheck/build/collectstatic green; **dual-lane Validation green**; additive migration only if the section-preference needs one (then **backup + restore spot-check**); Administrator restart; **phone screenshots headline** (collapsed overview; expanded AI review; "Approve all shown" over a visible list — live use on the owner's real note is fine, it's his data and the desired outcome). **Closure quotes head hash + Validation run ID.** Evidence as `SPRINT24_EVIDENCE.md`.

10. ROUND 2 (added 2026-07-06 — live issues found in field use before any closure was recorded)

Sprint 24's features are observably deployed, but **no closure evidence has been**

received (no hashes/runs for 23R2 or 24R1) and live use found defects. Round 2:

- **(i) Title save bug — highest priority.** An approved/edited title persisted as a fragment ("Canadian $1 m"). Reproduce with the exact string; fix whether it's truncation on the approve-apply write or a broken save on the reorganised Core-details form; **regression test: the full approved title string persists and re-renders**; audit other text fields on the new form for the same save path.
- **(ii) Structured suggestions render human-readably.** Catalogue-ref candidates must display formatted (e.g. **"Pick: PM-40a"**), never raw JSON; generic renderer for structured payloads with the raw payload behind a details toggle. Applies to any repeater-type suggestion.
- **(iii) Safe-area regression.** The reorganised item page's sticky header (Expand/Collapse all) and the review controls sit under the iOS status bar — apply the established top safe-area inset (Sprint 16/19 standard) across the new screens. Proof: screenshots clear of the clock.
- **(iv) Rationale metadata.** Move the "AI call <uuid>" audit reference out of the user-facing rationale prose onto a quiet metadata line (audit linkage unchanged).
- **(v) Working as intended — do not "fix":** competing catalogue candidates (e.g. 1954-series vs a design-based 1967 ref) are the candidates-only mechanism functioning; the human adjudicates. Leave the behaviour; the CANDIDATE chips already signal it.
- **(vi) Closure evidence catch-up:** file the outstanding closure reports for **Sprint 23 round 2** and **Sprint 24 round 1** (head hashes, Validation run IDs, suites, proofs) alongside this round's evidence so the record can close honestly.

11. Acceptance criteria — round 2 additions

- Full-title round-trip regression test green + live proof on the owner's note.
- Structured suggestions render formatted (test with a catalogue-ref payload); raw behind a toggle.
- New screens clear of the status bar at 390 px (screenshots).
- Rationale shows no inline audit UUID; metadata line present.
- Closure evidence for 23R2 + 24R1 + 24R2 filed with **hashes + run IDs** (standing norm).

9. For Codex

Reasoning: High. The one line that must not blur: **batch approve is a convenience over a fully visible reviewed list — per-field sign-off remains the spine (D-114); nothing ever persists without explicit human action.** Scope stays config; drafts stay drafts until approved; candidates/observations rules untouched. Reorganisation must lose nothing. **Never echo `.env` values** — the rotation is still in progress. Evidence as `SPRINT24_EVIDENCE.md` with hash + run ID.
